MVV Netze GmbH Multi-utility system

PSIcontrol

Multi-utility control center for energy, water, gas and district heating networks

MVV NETZE

MVV Netze GmbH, a company of the MVV Energie AG and and plans, builds and operates the energy networks, the district heating network, the water network and the hydroelectric power station in Mannheim and in the neighbouring towns.

With the powerful combined energies control centre, MVV Netze has a network competence centre with which the company reliably controls and monitors the generation and distribution of electricity, gas, water and district heating.

The innovative PSIcontrol system was developed and realised by PSI. In close cooperation with system operators, the system was tailored to the individual requirements of MVV Netze, who uses its combined energies control centre to provide services to industry and utilities. The staff members

monitor and control networks, which are completely geographically separated from each other, from one location. A further task is the dispatching for economic network management.
